

DeliveryBuddy MK2

Install & Usage Guide - food / product delivery profit analyzer (Uber - DoorDash - Grubhub)

1. What it is

DeliveryBuddy MK2 is a single-file, installable web app (PWA) that tells you whether a

delivery offer is worth taking. You enter the payout, miles, and number of stops; it grades the offer against your target \$/hr after fuel and deadhead (empty miles back).

Everything runs on your phone. There is no account, no server, and no data leaves the

device - all history is stored locally in the browser.

It is a profit ANALYZER only. It does not auto-accept offers or automate the delivery

apps in any way.

2. What you need

- * An Android phone (built and tested on a Pixel 9) with Chrome, or any modern browser.
- * The app folder "deliverybuddymk2" containing: index.html, manifest.webmanifest, sw.js, and icon.svg.
- * A way to serve the folder over https or localhost (see Section 3). Opening the file directly with file:// will show the app but WILL NOT install or accept screenshots.

3. Install on your phone

Why hosting is required

Install + Share-to-app (screenshot OCR) only work over https or localhost. Pick ONE of

the hosting options below, then do "Add to Home screen".

Option A - GitHub Pages (free, permanent link)

- * Create a new GitHub repository and upload the four app files to the root.
- * In the repo: Settings > Pages > Build from branch > main > / (root) > Save.
- * Wait ~1 minute; open the <https://<you>.github.io/<repo>/> link on your phone.

Option B - Netlify / Cloudflare Pages (drag-and-drop)

- * Go to app.netlify.com (or Cloudflare Pages) and sign in.
- * Drag the "deliverybuddymk2" folder onto the deploy area.
- * Open the generated https link on your phone.

Option C - Local server (same Wi-Fi, no internet host)

From the folder on a computer, run one of:

```
python -m http.server 8732
```

```
npx serve .
```

Then on the phone (same Wi-Fi) open <http://<computer-ip>:8732/>. Note: a plain LAN IP over http counts as "not secure", so install may be blocked - use localhost on the device itself, or prefer Option A/B for the real phone install.

Add to Home screen / Install

- * Open the hosted link in Chrome on the phone.
- * Tap the menu (three dots) > "Install app" or "Add to Home screen".
- * Launch it from the new icon - it now runs full-screen like a native app and works offline (the service worker caches it).

4. First-time setup (More tab)

Open the "More" tab and set these once so the math fits your car and goals:

- * Target \$/hr - the bar every offer must clear (default \$20).
- * Daily goal \$ - drives the progress bar on Stats (default \$150).
- * Grade on NET - on = grade after fuel cost (recommended); off = grade on gross.
- * MPG and Gas price - your fuel economy and local pump price (default 25 mpg / \$3.50).
- * Return factor - share of miles you drive back empty (default 0.40 = 40%).
- * Avg speed, First-stop wait, Extra-stop wait, Idle min - the drive/wait model.
- * Tax set-aside % - what to park for taxes (default 25%).
- * IRS rate - mileage deduction estimate shown in Stats (default \$0.67/mi).

Optional comfort toggles: "Speak the verdict" (reads the result aloud) and "Driving mode" (bigger buttons and text for hands-light use).

5. The five tabs

- * Offer - enter an offer and Analyze it; this is the home screen.
- * Stats - net profit, daily-goal bar, real \$/hr, accept rate, taxes, expenses, forecast.
- * History- every analyzed/accepted offer; mark done, add tips, backfill miles, delete.
- * Min \$ - reference table: the minimum payout to clear your target at each distance.
- * More - all settings, plus backup / restore / CSV export.

6. Daily workflow

Standard (you have a moment to read the offer)

- * On the Offer tab, type the payout and miles, set the number of stops.
- * Tap Analyze. You get a verdict (GREAT / WORTH IT / BORDERLINE / SKIP IT), an acceptance score 0-100, the net \$, and the real \$/hr after fuel + deadhead.
- * Tap "Accept & Start" if you take it, or "Decline" to log the pass.

When you must accept FIRST (no time to read)

- * Tap "Confirm Ride Now" - it logs the start time instantly, even with empty fields.
- * Later, open History and backfill payout / miles, then "Mark done" to stamp the end time and compute your real \$/hr and actual \$/mi. "Tip" sets the final payout.

Compare two stacked offers

- * Analyze offer A, tap the COMPARE button to hold it, then analyze offer B - the app shows which one wins.

7. Fast input options

- * Screenshot OCR - share a screenshot of the offer to DeliveryBuddy (Android share sheet). It reads the largest \$ as payout, the first "x mi", and the stop count, then auto-analyzes. (On-device, lazy-loaded; needs the installed app.)
- * Voice entry - tap the mic and say e.g. "9 dollars 50, 4 miles, 2 stops".
- * Paste - copy offer text, tap Paste, and it parses the same way.

8. Shifts, stats, taxes & expenses

- * Start shift / End shift (Stats tab) tracks your real online hours so \$/hr is honest.
- * Stats window toggles Today / 7-day / All.
- * Tax jar shows what to set aside (your % of take-home, never on a loss).
- * Expense tracker - add gas, tolls, supplies; they reduce take-home and the tax basis.
- * Earnings forecast projects today's pace to your shift-goal hours.
- * Decline-regret flags declined offers that would have beaten your average.
- * Weather-aware target - optional one-tap check (free, no key) suggests +10% target in rough conditions; it fails gracefully if you decline location.

9. Backup, restore & export

- * Export JSON (More tab) saves a full backup: settings, history, shifts, expenses.
- * Import JSON restores a backup. Malformed files are rejected safely.
- * Export CSV gives a spreadsheet of your history (one row per offer, with the score).

Tip: export a JSON backup before clearing history or switching phones.

10. Privacy & data

- * 100% on-device. No account, no analytics, no server calls (except the optional weather check and the one-time OCR engine download).
- * Data lives in your browser storage under "db-*" keys. Clearing browser data or uninstalling removes it - keep a JSON backup.

11. Troubleshooting

No "Install" option appears

- * You are likely on file:// or plain http. Use https (Option A/B) and open in Chrome.

Sharing a screenshot does nothing

- * Share Target only works after the app is installed from an https origin.

Numbers look wrong after importing an old backup

- * The app sanitizes imported data on load, but check the More tab values (MPG, gas, target) match your setup - a bad import is coerced to safe defaults, not your prefs.

OCR misreads an offer

* Screenshots vary by app; just correct the payout/miles fields and re-Analyze.

Single-file PWA - no backend - all data on your device. Drive safe and pick the good offers.
